

Test

Qualification: sdafsdafsfd

Department: Critical Care

Designation: sdfsadfsdaf

Languages: English, Hindi, Telugu

Experience: 4 yrs

About the Doctor

Bromocriptine is a dopamine receptor agonist used to treat hyperprolactinemia or excess prolactin hormone production and improve women's fertility. Prolactin is a hormone secreted by the pituitary gland in females to promote milk production during nursing and breastfeeding. But in some cases, if there is a tumour in the pituitary gland, the hormone is produced in excess leading to undesirable side effects like disturbances in the menstrual cycle, nipple discharge, infertility, and hypogonadism. Bromocriptine is used in its oral form to shrink such tumors, causing hyperprolactinemia.
